

## Try the world's most powerful anomaly detection technology

### Find real-time anomalies in your streaming data

HTM, or Hierarchical Temporal Memory, is a machine intelligence technology modeled after the only existing intelligent system today: the human brain. This biologically accurate technology learns time-based patterns in unlabeled streaming data, making it ideal for prediction, classification and anomaly detection.

Now there's an easy way to test whether HTM will find anomalies in your data. With HTM Studio, you can discover within minutes what anomalies can be found in your own streaming data sets. Simply add your data to HTM Studio and with the click of a button, it will display anomalies that other techniques cannot find.

- 1 Add local csv files quickly — no upload or privacy issues
- 2 Discover anomalies with one click — no coding skills required
- 3 Visualize and export your results

If HTM Studio finds anomalies, you are ready to integrate HTMs into your system.
